Aquarium Maze

Problem

- Input: grid of "." and "#" squares.
- Grid is filled with water from the top.
- Water can move down, left and right.

Solution

- Can simulate water by starting at a top square and then traversing the graph e.g. using BFS or DFS
    1. if square == "." and not yet visited
    2. visit all neighbours recursively
    3. add 1 to awnser

Gotchas

- Need to start once at every point on the top.
- Otherwise we might miss some air bubbles.

BicycleLock

Problem

- Input: Initial lock position I and final lock position F of length n.
- Move to final position by always turning two consecutive dials at once.

Solution

- Dial 1 can only be turned by turning dials 1 and 2.
- It needs to be turned from I_1 to I_2.
- After turning that, we have a new subproblem of length $n - 1$
- We can solve this recursively

Gotchas

- Always two ways to turn dials: Clockwise or Anti-clockwise.
- Need to check if dial n is at the right positition in the end.

CompilersBrackets

Problem

- Check if given bracket pattern makes sense.
- $\{\}\{\}$ Does not make sense.
- $\{\}\{\{\}\}$ Does make sense.

Solution

- Count number of currently open brackets.
- begin with open $= 0$
- "$\{$" $\rightarrow$ open$++$
- "$\}$" $\rightarrow$ open$--$
- pattern invalid if open < 0 at any time.
- pattern invalid if open $! = 0$ in the end.

DamConstruction

Problem

- Given (n_1, n_2, n_4) lego bricks of size 1, 2 and 4.
- Build the highest wall of width w.

Solution

- Should always use bricks of higher size first to maintain flexibility.
- Greedy solution by using n_4 bricks, then filling up with n_2, then with n_1.

ExtravagantVoyage

Problem

Gotchas

-

FascinatingBooks

Problem

- Check if given list of strings contains every letter of the alphabet.

Solution

- Can concatenate strings and solve for a single string.
- For each char:
- If char is letter: Add lowercase version to set.
- Check if length of set is 26.

Gotchas

- Capitalization does not matter.
- Strings do not only contain letters

Problem

-

Solution

-

Gotchas

-

HiddenWords

Problem

- TODO: make description more clear.
- Given n strings, find a string that contains all n strings in the right order and where no character is part of 3 strings.

Solution

- Start with two first strings X and Y.
- If Y starts with X:
- Add X to solutionword, continue with rest of Y and next string.
- Else: Remove first letter of X and repeat process.

IntuitiveCitations

Problem

- Given a list of names. Print the lexicographically smallest surname and add " et al.".

Solution

- Remove part before space (prename).
- Find the lexicographically smallest string by sorting and taking the first element.
- print string + " et al.".

LeaderboardPrediction

Problem

- Given the times you need to solve each of the n problems.
- Determine the minimal penalty you can get on the contest.

Solution

- The time you needed for the first problem will be added to the penalty of all problems you solve.
- It is always best to solve shortest problems first.
- Greedy solution: Sort problems by length, then simulate.
